To Whom It May Concern:

I have been using Measurement Masters P.E.P. for about 5 years. I use P.E.P. to tool path 3 lasers, 2 Cincinnati's and a Trumpf TL4030.

I have been very pleased with P.E.P., the software works great. It is very easy to learn. I have trained 5 other people to use it. The functionality is incredible, the automatic nesting routine saves oodles of time. P.E.P. optimizes the sheet program to keep the head down, which saves hours of processing time.

The software can pretty much run itself if you let it. The average time to manual program with P.E.P. is about 15 minutes and that's hand massaging the shapes and making various decisions. The automatic programming time is about 2-3 minutes start-to-finish.

I personally love the combine cutting routines which save processing time and material. When we combined the use of P.E.P. with our new TL4030 its power and speed and the combined cutting routines of P.E.P., it chews through the plate like gauge material with very little waste. I can print usage reports on material utilization to verify this by default. I prefer to combine cut whenever possible. In production situations it's a huge competitive edge.

I found that P.E.P. is a well thought out package and easy to use. It is very easy to pickup and learn rapidly, and become very advanced very quickly. I have found over the years that no one has beaten Measurement Masters functionality. The P.E.P. package continues to evolve and they continually introduce new and innovative functionality.

Thank you,

James Harriman
