Dear Bob Jenks:

I am writing this letter to thank you for adding 2 features in particular to the Cad Draw module, "offset geometry " and "move geometry to another layer". These two features alone will save us at least 5 hours a week in modifying geometry on customer files to allow for machine stock. These features are great for all of the parts we flame cut that have interior cutouts and external areas that require added machine stock, because now we can select all of the internal geometry at one time and specify how much stock we need in offset and the stock allowance is made to all of the geometries at one time. Also by moving the exterior geometry to another layer first makes it much easier to grab the internal holes, and when we finish with them we just turn the outside layer on, offset the areas needed on that layer and the part is ready to convert. This is a slick feature!!!! In the past we had to modify these geometries to the file using other software and then save the modified file and then convert it in PEP. These added features will sell themselves to anyone who has spent any time at all modifying files, they will try it once and see the speed and ease of using it.

Thanks again to you Bob, and to all of your staff, who have been so helpful in supporting us when we have had any problems or questions.

Sincerely, Dave Hess , Plate Dept. Manager.
